Summary

Self-taught systems administrator with four years of experience operating public-facing internet services on self-managed hardware, including a Matrix homeserver with over 200 active users. Comfortable across Linux administration, networking, NGINX, and web hosting, including rebuilding a full platform from scratch following an unrecoverable database failure. Currently running a two-node Proxmox cluster with Ceph distributed storage while working through PostgreSQL replication and high availability. Seeking a first full-time role in IT support or systems administration.

Skills

Proficient: Linux system administration, NGINX, DNS, TLS/SSL certificates, reverse proxying, firewall configuration, self-hosted service deployment, Matrix/Synapse administration, Python, hardware troubleshooting and repair

Familiar: Proxmox VE, Ceph distributed storage, virtualization, Java, PostgreSQL, network-attached storage, local LLM deployment, Fediverse & federated technologies.

Projects

Public Internet Services (First Plus St, then Constellatory) | 2022 – 2025

Maintained a set of publicly accessible, privacy-focused, open source projects for the public to use, run on self-managed hardware and infrastructure.

- Administered and moderated a popular Matrix homeserver that hosted over 200 active users.
- Rebuilt the infrastructure from scratch following an unrecoverable database failure, re-architecting around a smaller, more robust service set to prioritize stability, correctness, and performance.
- Handled the day-to-day work of managing a full stack environment: Linux administration, networking, NGINX, S3, DNS, and uptime.

FediForgetMe | 2025 | github.com/itzzenxx/fediforgetme

A script written in Python to bulk-remove content from a Mastodon API-compatible Fediverse server. Iterates through a user's posts, favorites, and reblogs, removing each entry individually. Works around incomplete data-deletion support in upstream server software.

prevent_media_downloads_from | 2023 | github.com/itzzenxx/prevent_media_downloads_from

Banning a malicious homeserver does not remove its cached media by default.

- Co-wrote a script that maintains a blocklist file homeservers read at startup, ensuring media from banned servers is neither retained nor newly ingested.

Multi-Node Proxmox VE Cluster | Current

A Proxmox cluster repurposed from two decommissioned workstations. Ceph provides redundant storage in place of RAID, making better use of the available hardware and enabling Proxmox's high availability features. The cluster provides an NGINX reverse proxy, PostgreSQL database, Samba NAS, authentik authentication, and local LLMs.

Experience

IT Support Intern @ Weston Public Schools, Weston, CT | June - July 2025

- Diagnosed and repaired student Chromebooks, including hardware replacement and re-imaging
- Provided end-user technical support to students and staff
- Assisted with end-of-year equipment collection, inventory, and facilities work

Education

Weston High School: High School Diploma | July 2025

- AP Computer Science A (Java): Score: 4/5
